From the above I can try and generalize a formula for the number of squares that can be produced from any square matrix of circles of dimension $n \mathrm{x} n$. The first thing I notice is that the smallest square must have two circles on a side, hence a $2 \times 2$, the largest square, an $n$ by $n$.

Now the number of 2 x 2 s across each row is $\mathrm{n}-1$. The number of rows that can be counted is also $\mathrm{n}-1$. In other words the number of $2 \times 2 \mathrm{~s}=(\mathrm{n}-1)(\mathrm{n}-1)$

The number of $3 \times 3$ s across each row is ( $n-2$ ). The number of rows that can be counted is $(n-2)$.
Total number of $3 \times 3 s=(n-2)(n-2)$.
Continue this until you get the final square which whose size is $\mathrm{n} x \mathrm{n}$ and can be found by multiplying ( $\mathrm{n}-(\mathrm{n}-$ 1)) $(n-(n-1))=1$

Now I have to add up the number of squares from a $2 \mathrm{x} 2,3 \mathrm{x} 3, \ldots, \mathrm{nxn}$ to get the final answer. So this is looking like a summation problem.

Making a table:

| k | Dimension of circle matrix | Sequence to sum | Sum |
| :--- | :--- | :--- | :--- |
| 1 | $1 \times 1$ | 0 | 0 |
| 2 | $2 \times 2$ | 1 | 1 |
| 3 | $3 \times 3$ | $4+1$ | 5 |
| 4 | $4 \times 4$ | $9+4+1$ | 14 |
| 5 | $5 \times 5$ | $16+9+4+1$ | 20 |
| M | mxm | $(\mathrm{m}-1)^{2}$ |  |

The last column from the bottom row is the sum of $(m-1)^{2}$ from $\sum_{1}^{m}(m-1)^{2}$
